

Installation Plan

Author: Jackson Luff

The following document outlines how to install and uninstall my columns game onto a web server. (For my actual game and in this demonstration, i use UniServerZ.)

INSTALLING ONTO A WEB SERVER

These installation instructions will use UniServerZ to give an explicit context to steps involved. The steps should be mostly transferable to other web server software packages. Be sure to check the specific requirements of your particular web server before beginning installation.

1. Download UniServerZ from <http://sourceforge.net/projects/miniserver/files/>
2. Follow the installation instructions for UniServerZ from http://www.uniformserver.com/ZeroXI_documentation/
3. Locate the 'www' folder within your UniServerZ directory.
4. Place the project folder inside the 'www' folder. (make sure to remove any spaces of the folder of your project inside 'www' to reduce the amount of possible bugs.)
5. Click the 'Start Apache' server on the main UI of the program.
6. For Windows, go to the start bar search and run the 'cmd.exe' application.
7. Input 'ipconfig' into the cmd input, and retrieve your IPv4 address.
8. Run your IPv4 address in your preferred internet browser.
9. You will be prompted with the standard UniServerZ internal webpage.
10. Click on your project name that displays near the bottom of the page.

You've successfully installed your website, congratulations.

UNINSTALLING FROM A WEB SERVER

These uninstallation instructions will use UniServerZ to give an explicit context to steps involved.

The steps should be mostly transferable to other web server software packages. Be sure to check the specific requirements of your particular web server before beginning uninstallation.

1. Locate the 'www' folder within your UniServerZ directory.
2. Check twice to insure that the apache server is not running.
3. Delete the project folder from inside the 'www' folder.

You've successfully uninstalled your website, congratulations.
